

# It's Your Cloud

Of course you can have it your way

One of the reasons we have cloud computing is flexibility. Forgive the pun, but when you are free from hardware and software restrictions, the sky's the limit. That's why you get to design your cloud infrastructure the way you want it. Here's how we do it:

## Shared

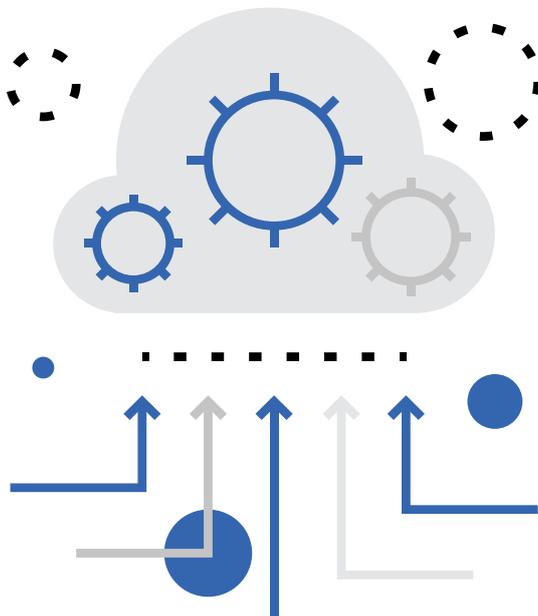

A shared cloud provides all the benefits of a customized software application, plus all the benefits of quintessential cloud computing. Clients are virtually and securely segmented while sharing the same web server farm with other companies. Multiple users access the same functional capabilities from the cloud – gaining significant economies of scale by sharing the development, management, maintenance, and deployment costs.

We apply all updates usually during off-hours and manage and administer the entire environment for you. You get the access. You get the benefits.

## Dedicated

A dedicated cloud provides the very same services available in the shared model. But servers and software are dedicated to just your company group. Add managed security and administrative services a la carte, and you've got yourself a cloud offering that is private and fully customized to your specific requirements.

Custom options include being able to put your servers in our data center (or one of your choice) and having us manage the application, the infrastructure, or both. Or, if you'd rather, we can manage your on-premise installation for you. Any way you choose, we do the work, you get the benefit.

## What Can We Create With You?

We work with you to understand your needs and goals - then we design and implement your infrastructure.

If you want more options, contact us today. We may just create something new together.
